Sir:

Transmitted herewith for filing is the Patent Application of:

Inventor(s): GLENN ALAN EHRGOTT

For : FAST TRACK SHELVING SYSTEM

Enclosed are:

- ☒ THIRTEEN (13) sheets of formal drawings (FIGURES 1-24).
- ☐ An Assignment of the invention, to:
- ☐ A certified copy of a _____ application.
- ☐ An Information Disclosure Statement, Form PTO 1449 and cited references.
- ☒ A Verified Statement to establish Small Entity status under 37 C.F.R. 1.9 and 37 C.F.R. 1.27.
- ☒ Executed ☐ unexecuted Declaration and Power of Attorney.
- ☒ A Filing Date as of the date of deposit in Express Mail is requested. The particulars of the Express Mail Deposit under 37 C.F.R. 1.10(b) are presented below.

EXPRESS MAIL "MAILING LABEL NO." : EE050908249US

DATE OF DEPOSIT : APRIL 30, 1999

Applicant : GLENN ALAN EHROGOTT
Application No. : Not yet assigned
Filed : Herewith
For : FAST TRACK SHELVING SYSTEM

**VERIFIED STATEMENT (DECLARATION) CLAIMING SMALL ENTITY
STATUS (37 C.F.R. 1.9(f) AND 1.27(b)) - INDEPENDENT INVENTOR**

As a below-named inventor, I hereby declare that I qualify as an independent inventor as defined in 37 C.F.R. 1.9(c) for purposes of paying reduced fees under Sections 41(a) and 41(b) of Title 35, United States Code, to the Patent and Trademark Office with regard to the invention entitled described in:

- ☒ the specification filed herewith
☐ Application No. _____, filed
☐ Patent No. _____, issued _____

I have not assigned, granted, conveyed, or licensed and am under no obligation under contract or law to assign, grant, convey, or license any rights in the invention either to any person who could not be classified as an independent inventor under 37 C.F.R. § 1.9(c) if that person had made the invention, or to any concern that would not qualify as either a small business concern under 37 C.F.R. § 1.9(d) or a nonprofit organization under 37 C.F.R. § 1.9(e).

Each person, concern or organization to which I have assigned, granted, conveyed, or licensed or am under an obligation under contract or law to assign, grant, convey, or license any rights in the invention is listed below:

- ☐ no such person, concern, or organization
☐ persons, concerns, or organizations listed below*

*NOTE: Separate verified statements are required from each named person, concern, or organization having rights to the invention averring to their status as small entities. (37 C.F.R. § 1.27.)

FULL NAME GLENN ALAN EHROGOTT
ADDRESS 7 SPRING LANE, LONG VALLEY, NJ 07853

☒ individual ☐ small business concern ☐ nonprofit organization

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code; and that such willful false statements may jeopardize the validity of the application, any patent issuing thereon, or any patent to which this verified statement is directed.

FAST TRACK SHELVING SYSTEM

10

FIELD OF THE INVENTION

15

The present invention relates to a storage system and more particularly to a storage system which is adjustable. The storage system comprises shelving support structures which are capable of supporting loads of various shapes and sizes. More specifically, the provided storage system is capable of supporting a cantilever load or tension load. The present invention provides a storage system which can be used more safely in a plurality of environments than the prior art.

20

BACKGROUND OF THE INVENTION

25

30

Wall-based and free-standing storage units are well-known in the art. Such units are either individually secured to a wall or cooperate with a dedicated rail, slot, or channel or are used with a peg board or slat wall arrangement. (See U.S. Patent Nos. 4,318,486; 4,723,663; 4,982,922; 4,867,623; 4,852,747; 5,224,609; 5,265,992; 5,322,256; 5,740,927; 5,807,047 and; 5,839,589). Such arrangement may utilize horizontal bars or rails on which brackets or hooks are mounted in order to support various items. Storage units have been described having hooks permanently attached to specified points on a bar. Other storage systems describe sliding brackets captured on a rail. Additionally, other storage systems provide a changeable, slidable bracket utilizing an open-ended fastener at the back of the bracket which

is slipped over the top of the rail. See, U.S. Patent No. 3,260,489. Further systems employ brackets with fasteners which are trapped on a rail (See, U.S. Patent Nos. 2,291,966 and 2,546,720). Further still, storage systems have been described which provide wall systems which are readily adjustable to differently shaped loads capable of supporting heavy loads. (See, U.S. Patent No. 4,318,486). Such systems provide a mounting rail carrying brackets with U-shaped fastener sections which grip the rail but which can be slipped off at one or more grooves in the rail. The wall based systems described herein above limit the type of devices that can be stored. The slidable variety of the systems limit the number of brackets or limit the changing of brackets after the rail or equivalent has been mounted. Importantly, in a mobile environment, brackets could slide in alignment with an open groove and become dislodged or cause stored materials to collide with one another. Other disclosures have provided storage systems and fittings to be employed with a track member wherein the fitting has a positive pivotal retainer means that may be easily operated for locking and unlocking the fitting relative to the track. Such systems provide a secure fitting of cargo for transportation.

Anchor fittings have also been described. Such fittings provide for removably attaching objects to the floor or wall of a vehicle. Such fittings may be operate in conjunction with a track attached to a vehicle floor with the track having alternate notch and neck proportions which matingly engage the fittings. (See, U.S. Pat. Nos. 2,688,504; 4,230,432; 4,256,424; 4,708,549; and 5,265,992). Such devices limit use to either a beam supported at both ends, a strap, or an anchor ring type device or opening which cooperates with common cargo control device such as a ratchet strap or load binder. Moreover, such devices do not provide for or solve the problem of a cantilever based storage system.

The present invention provide distinct advantages over the prior art and solves numerous problems long-described and understood in the field.

SUMMARY OF THE INVENTION

5 It is therefore an object of this invention to provide a storage device comprising (a) a receiving member comprising one or more receiving member receptacles, the receiving member receptacle being defined by opposing end edges; and (b) an insertion member comprising (i) a body portion capable of supporting a cantilever load and (ii) a retention device portion capable of being stably inserted into the receiving member receptacle.

10 More specifically, it is an object of this invention to provide a free standing storage system. It is also an object of this invention to provide a storage system mountable to a fixed surface. Additionally, it is an object of the present invention to provide the receiving member of the provided storage system. Also, it is a further object of the present invention to provide the insertion member of the provided storage system.

15 Finally, it is an object of this invention to provide a method for storage of implements comprising using the provided storage system.

BRIEF DESCRIPTION OF THE FIGURES

20 **FIGURE 1.** Cargo Control Track. Cargo Control Track **140** is shown installed in various common vehicles such as on the floor of a flatbed rail car **104**, on the walls of a tractor trailer cargo trailer **106**, and on the walls of a railroad boxcar **108**.

FIGURE 2. Top Plan of the Trailer of Figure 1. Top cutaway view inside the tractor trailer
25 along reference line 2 of Figure 1. This exemplifies a typical application of cargo control

track 140 used to brace heavy cargo 122 from moving using cargo control pockets 124 and cargo control beams supported at both ends 126.

FIGURE 3. Use of cargo control tracks 140 to support cargo control beams 136 in cargo control track receiving member receptacles 142 to support palletized cargo 138 inside a trailer 134 pulled by a truck 132 in a typical tractor trailer combination 130.

FIGURE 4. Cargo control track 140 mounted to a planar surface 146 through the use of screws 152 placed through mounting holes 144. As alternatives to screws, a variety of fastening methods is contemplated including but not limited to bolts, welding, riveting, expansion anchors, and adhesives. The cargo control track may also be directly connected to another singular or multiple support member(s) such as a steel hat section 148 or wooden stud 150.

FIGURE 5. Track sections including horizontal E-track 154, vertical E-track 156, horizontal A-track 158, vertical A-track 160, and series A-track 162. Such typical configurations are readily available and are used to provide one or more receiving member receptacles 142.

FIGURE 6. Cross sectional view of a receiving member receptacle 142 in cargo control track 140, a fastener 152 and a cutaway view of cargo control track 140 attached to a supporting surface 146.

FIGURE 7. Typical retention device 164 comprising an upper resilient finger 166 adjacent to an upper notch 168 enabling lifting retention device 164 while inserting upper finger 166 high enough to allow lower resilient finger 170 to clear the lower opposing end edge 172 of the receiving member receptacle 142 and be lowered.

FIGURE 8. Lower notch 174 engages the lower opposing end edge 172 of the receiving member receptacle 142. To remove the retention device, the retention device 164 is lifted, tipped tilted or pivoted and lowered from the receiving member receptacle.

FIGURE 9. Engagement of the retention device in a receiving member receptacle as in Figure 8 adding a positive engagement latch 176 pulled back to enable lifting retention device 164 into the receiving member receptacle 142.

FIGURE 10. The positive engagement latch 176 engaged in a position that restricts motion of the retention device thereby preventing its removal from the receiving member receptacle 142. To remove the fitting, positive engagement latch 176 is pulled back away from the receiving member receptacle 142, thereby enabling sufficient motion of the retention device 164 thereby enabling removal from the receiving member receptacle 142.

FIGURE 11. Detail showing a simple hook profile 178 formed in one piece of stamped metal, including holes 180 through which a retaining rivet or other fastener may be inserted and an embossed area 182 for centering a spring. Simple hooks in a preferred embodiment consist of a stamped metal form including a retention device 164.

FIGURE 12. Stamped form of Figure 11, bent to a shape whereby the outer measurement snugly fits into the receiving member receptacle, the end of which forms a retention device 164 (See, Figure 7). A positive retention latching device 176 (See, Figure 13) is capable of being inserted between the parallel planar surfaces 190 and 192. Holes 194 and 196 when in alignment enable insertion of a rivet pin therethrough.

FIGURE 13. A latch profile 176, including a finger actuated tab 198, a hole 200 which is slightly larger in diameter than a rivet 186, and a spring tab 188 which holds a spring 184, and at proper length acts as a pivotal motion limit.

FIGURE 14. Latch profile 176 inserted between parallel planar surfaces 190 and 192 with spring 184 retained on spring tab 188 and held in place with rivet 186. The height of surface 202 is disposed in proximity as to cause an interference in upper notch 168 (See, Figure 7) by the action of spring 184 thereby preventing removal of the retention device from the receiving member receptacle 142 (See Figure 10).

FIGURE 15. Shelf bracket with profile terminating in a retention device and fitted with a positive retention latch 176.

FIGURES 16A-16B. Rake or Shovel Bracket. **Figure 16A.** Pre-bent flat diecut stamped shape. Flange 210 provides improved stability. **Figure 16B.** Flange 210 is shown bent back toward the cargo control track 140, provides interference with the receiving member cargo control track surface thereby providing enhanced stability, limiting horizontal movement of the retention device. Four additional bends 204 allow widening of the area between the parallel planar surfaces 190 and 192 in order to enable accommodation of handles or add stability to objects for storage. Two extended tabs 206 are provided of an extended height in order to better retain stored implements. The length of the protruding arms 208 is variable as is its contour and shape.

FIGURE 17. Devices exemplifying use of series E/A spring loaded fittings 212 together with a bent wire form 214 welded to the fitting.

FIGURE 18. Rake or Shovel Hook exemplifying attached double hook shape which may be welded, bolted, crimped or inserted to a standard E-clip fastener. A spring loaded fitting 212, welded 220 to a long wire form hook 216, and a stabilizer tab 218 fitted to the fastener in order to create interference with the surface of the cargo control track thereby providing enhanced stability, limiting horizontal movement of the retention device.

FIGURE 19. Wire form hook shapes attached to spring loaded fittings including examples of tension load devices incorporating an insertion device 212 attached to variable contour and shape protruding arms 220, 240 and 226 designed to support loads from an overhead receiving member cargo control track member such as in a ceiling-mounted application.

- 5 **FIGURE 20.** Cantilever support member such as a shelf bracket is formed by welding a standard wood beam socket 228, to a rigid extended member 230 body portion. An extended retention plate on the end 232 is provided in this example.

FIGURE 21. Various implements, including shovels 236, rakes 234, cords 240, cans 238 stored respectively on brackets 246, 244, 248 and shelf 242, wherein the brackets and shelf
10 are arranged cooperating with track 140.

FIGURE 22. Example of a free-standing rack system shown constructed of rigid box tube uprights 250 comprising receiving member receptacles 142 cooperating with small beam sockets 252 and shelf support beams 256. This example includes optional caster wheels 254.

FIGURE 23. Rigid box tube uprights 250 with receiving member receptacles 142
15 cooperating with small beam sockets 252 and shelf support beams 256 shown in this example with wall mounted cargo control track 140.

FIGURE 24. Cargo Control Track 140 shown in this example mounted in an overhead (ceiling) mounted application cooperating with hook profiles 226 and attached to a spring-loaded fitting 212 and supporting a bicycle 258 and skis 260.

DETAILED DESCRIPTION OF THE INVENTION

The present invention provides a storage device comprising (a) a receiving member comprising one or more receiving member receptacles, the receiving member receptacle being defined by opposing end edges; and (b) an insertion member comprising (i) a body portion capable of directly supporting a load and (ii) a retention device portion capable of being stably inserted into the receiving member receptacle.

The present invention provides a storage device comprising (a) a receiving member comprising one or more receiving member receptacles, the receiving member receptacle being defined by opposing end edges; and (b) an insertion member comprising (i) a body portion capable of supporting a cantilever load and (ii) a retention device portion capable of being stably inserted into the receiving member receptacle. An alternative embodiment of the present invention is the insertion member comprising a body portion capable of supporting a tension load.

In one embodiment of the present invention, the retention device portion comprises one or more notches which define one or more resilient fingers, the notch formed to snugly fit into the receiving member receptacle. According to an embodiment of this invention the retention device portion comprises an upper notch and an opposing lower notch. According to an embodiment of this invention, the distance between the resilient fingers adjacent the upper notch and the resilient fingers adjacent the opposing lower notch is greater than the distance between the opposing end edges defining the receiving member receptacle.

According to another embodiment of the present invention, the retention device portion comprises one or more resilient fingers positioned so as to contact and engage an opposing end edge of the receiving member receptacle. According to an embodiment of this invention, the retention device portion further comprises one or more notches which define

one or more resilient fingers adjacent the notch and positioned so as to contact and engage an opposing end edge of the receiving member receptacle. According to still another embodiment of this invention, the upper notch is larger than the lower notch.

According to a further embodiment of the present invention, the retention device
5 portion further comprises a latching device capable of interfering with one of the opposing
end edges of the receiving member receptacle. According to an embodiment of this invention,
the latching device is movable with respect to the retention device portion. The latch may
pivot, tilt, turn or slide. According to still another embodiment of this invention, the latching
device comprises a mechanically actuated lever. According to still another embodiment of this
10 invention, the mechanically actuated lever is actuated by compressing a resilient material.
According to an embodiment of this invention, the resilient material is a spring. According to
yet still another embodiment of the present invention, the latching device is disposed within
the notch. According to an embodiment of the invention, the latching device or a portion
thereof pivots with respect to the retention device portion. According to still yet another
15 embodiment, of the present invention, the latching device or a portion thereof slides with
respect to the retention device portion. Yet further, according to another embodiment of the
present invention, the latching device is disposed between the resilient fingers and positioned
so as to contact and engage an opposing end edge of the receiving member receptacle.

According to yet another embodiment of the present invention, a plurality of receiving
20 member receptacles are linearly positioned along the receiving member. According to one
embodiment of this invention, receiving member receptacle is rectangular in shape. In another
embodiment the receiving member receptacle is square in shape. In yet another embodiment
the receiving member receptacle is oblong in shape. In still another embodiment, the receiving

member receptacle is ovoid in shape. In still yet another embodiment the receiving member receptacle is about circular in shape. In a further still embodiment, the receiving member receptacle is irregular in shape. It is contemplated that the receiving member receptacle may be of a variety of shapes and sizes and depths and widths and lengths. In a preferred
5 embodiment, the receiving member receptacle is rectangular.

According to a further embodiment of the present invention, the receiving member is formed from one of the group consisting of (metal, wood and plastic). It is contemplated that the receiving member may be fashioned from a variety of materials. In a preferred embodiment, the receiving member is metal. In a more preferred embodiment, the receiving
10 member is formed from aluminum or steel. It is further contemplated that the receiving member may be light in weight while still retaining capacity to bear a significant cantilever weight load. According to a still further embodiment of the present invention, the receiving member is capable of being removably mounted on a fixed surface.

According to a yet still further embodiment of the present invention, body portion of
15 the insertion member is elongated. According to one embodiment of the present invention, the body portion of the insertion member is selected from the group consisting of a hook, a ring a pronged implement holder and a bracket. It is contemplated that the body portion of the insertion member is capable of bearing a significant cantilever weight load. It is further contemplated that the body portion of the insertion member is capable of stably retaining a
20 variety of implements including but not limited to tools, lumber, beams, girders, wire and lines.

Further still, the present invention provides a free standing storage system. Yet further still, the present invention provides a storage system mounted to a fixed surface. According

to an embodiment of this invention, the storage system is easily disassembled. According to another embodiment of this invention, the storage system is adjustable in height, length, density and spacing. According to still another embodiment of the present invention, the orientation of the receiving member is horizontal, vertical or diagonal.

5 Additionally, the present invention provides the receiving member of the provided storage system. Also, the present invention provides the insertion member of the provided storage system.

 Finally, the present invention provides a method for storage of implements comprising using the provided storage system.

10 The present invention may be practiced using common cargo control track. Such track is exemplified by but not limited to track known in the art as "E-track" or "A-track." Such track is a basis of providing horizontal and vertical track sections, as well as individual brackets with one or more receiving member receptacles. The track can be fastened to walls, ceilings, floors, or other fixed surfaces. Alternatively, the track may be fixed to or as free-
15 standing support structures in order to provide a series of receiving member receptacles in which to engage insertion members as storage supports. Such a practice enables the user to hold various implements including, but not limited to shovels, rakes, pick axes, hammers, electrical extension cords, bicycles, spare tires, skis, shelves, emergency equipment and hoses. It is contemplated that the track or receiving member is fastened to an interior of an
20 emergency vehicle. It is further contemplated that the track is fastened to the outside of such a vehicle or other type of mobile structure. The receiving member or its components and accessory devices may be color-coded. Such color coding facilitates rapid assembly of the system. Alternatively, emergency colors such as florescent yellow or orange or red provides

indication of various emergency equipment. In another alternative example, color coding may indicate compatibility between various stored implements such as in an technical, medical, pharmaceutical, electrical or plumbing application. Moreover, in a technical setting or a medical setting, such color coding provides indication of compatible equipment, reagents, therapeutics or a particular sequence of use thereof.

A retention device is provided with the various storage support devices which allows them to be added or removed from the mounting track individually with or without tools, and without requiring the removal of adjacent support devices, providing ease of use and accommodating a number of combination of implements. Provision for a positive retention in the form of a latching device is also provided. Positive retention of insertion member support devices eliminates accidental dislodging thereby facilitating use in a wide variety of environments. Mobile environments, in particular are enabled by the positive retention latching device. Moreover, positive retention latches are not easily dislodged through motion and impact which is often associated with the removal and replacement of stored items. This makes the storage system of the present invention safer to use. The storage system of the present invention provides for the display of a number of different shaped and weighted items in a plurality of environments and settings.

As used herein, the term "cantilever" means a projecting beam, girder, post, pole, platform or other structure supported only at one end. As used herein, the term "pivot" means the rotation, swinging or shifting of a short rod, shaft or other member about a related part or member. As used herein, the term "receptacle" refers to an opening, space, groove, slot or hole capable of accepting by insertion another member or part. As used herein, the term

"implement" means a tool, device or other utensil including, but not limited to a shovel, a rake, an axe, a spare tire, a cord, a wire, a hammer, a shelf, a hose and a jack.

Referring now to the figures: The Cargo Control Track referred to as the "receiving member" of the provided storage system is shown in Figure 1. Cargo Control Track **140** is shown installed in various common vehicles such as on the floor of a flatbed rail car **104**, on the walls of a tractor-trailer cargo trailer **106**, and on the walls of a railroad boxcar **108**. Figure 2 shows the top plan of the trailer of Figure 1. The top cutaway view inside the tractor-trailer is shown along reference line 2 of Figure 1. This exemplifies a typical application of cargo control track **140** used to brace heavy cargo **122** from moving using cargo control pockets **124** and cargo control beams supported at both ends **126**. Figure 3 depicts the use of cargo control tracks **140** to support cargo control beams **136** in cargo control track receiving member receptacles **142** to support palletized cargo **138** inside a trailer **134** pulled by a truck **132** in a typical tractor trailer combination **130**. Figure 4 presents cargo control track **140** mounted to a planar surface **146** through the use of screws **152** placed through mounting holes **144**. As alternatives to screws, a variety of fastening methods is contemplated including but not limited to bolts, welding, riveting, expansion anchors, and adhesives. The cargo control track may also be directly connected to another singular or multiple support member(s) such as a steel hat section **148** or wooden stud **150**. In another embodiment of this invention, the track may be formulated as a free-standing structure. An example of a free-standing structure is a table. The present invention contemplates a variety of free-standing structures including, but not limited to a table, a bench, a bookcase and a cabinet. Moreover, the present invention further contemplates a free-standing structure comprising wheels. An example of such a formulation is a cart.

Figure 5 depicts track sections including horizontal E-track 154, vertical E-track 156, horizontal A-track 158, vertical A-track 160, and series A-track 162. Such typical configurations are readily available and are used to provide one or more receiving member receptacles 142.

5 Figure 6 exhibits a cross sectional view of a receiving member receptacle 142 in cargo control track 140, the cargo control track, a fastener 152, a cutaway view of cargo control track 140 attached to a supporting surface 146. Figure 7 describes a typical retention device 164 comprising an upper resilient finger 166 adjacent to an upper notch 168 enabling lifting retention end 164 while inserting upper finger 166 high enough to allow lower resilient finger 170 to clear the lower opposing end edge 172 of the receiving member receptacle 142 and be lowered. The lower notch 174 of Figure 8 engages the lower opposing end edge 172 of the receiving member receptacle 142. To remove the retention device, the retention device 164 is lifted, tipped or tilted and lowered from the receiving member receptacle. Figure 9 describes engagement of the retention device in a receiving member receptacle as in Figure 8 adding a positive engagement latch 176 pulled back to enable lifting retention device 164 into the receiving member receptacle. Figure 10 exemplifies the positive engagement latch 176 engaged in a position that restricts motion of the retention device thereby preventing its removal from the receiving member receptacle 142. To remove the fitting, positive engagement latch 176 is pulled back, enabling sufficient motion of the retention device 164 thereby enabling removal from the receiving member receptacle 142. Figure 11 details a simple hook profile 178 formed in one piece of stamped metal, including holes 180 through which a retaining rivet may be inserted and an embossed area 182 for centering a spring. Simple hooks in a preferred embodiment consist of a stamped metal form including a retention

device 164. Figure 12 displays the stamped form of Figure 11, bent to a shape whereby the outer measurement snugly fits into the retention hole of cargo control track. A positive retention latching device is capable of being inserted between the parallel planar surfaces 190 and 192. Holes 194 and 196 must be in alignment to enable insertion of a rivet pin therethrough.

Figure 13 shows a latch profile 176, including a finger actuated tab 198, a hole 200 which is slightly large in diameter than a rivet 186, and a spring tab 188 which holds a spring, and at proper length acts as a pivotal motion limit and an interference surface 202. The latch profile 176 is shown in Figure 14 as inserted between parallel planar surfaces 190 and 192 with spring 184 retained on spring tab 188 and held in place with rivet 186. The height of the interference surface 202 is disposed in proximity as to cause an interference in upper notch 168 by the action of spring 184 thereby preventing removal of the retention device from the cargo control receiving member receptacle 142 (See Figure 10). A shelf bracket with profile terminating in a retention device and fitted with a positive retention latch 176 is shown in Figure 15. Figure 16 describes four additional bends 204 allow widening of the area between the parallel planar surfaces 190 and 192 in order to enable accommodation of handles or add stability to objects for storage. Two extended tabs 206 are provided of an extended height in order to better retain stored implements. The length of the protruding arms 208 is variable as is its contour and shape. Flange 210 provides improved stability. Flange 210, shown bent back toward the cargo control track 140, provides interference with the cargo control track surface thereby providing enhanced stability, limiting horizontal movement of the retention device.

Devices exemplifying use of series E/A spring loaded fittings are shown in Figure 17. An example of a commercially available E/A spring loaded fitting is Kinedyne Model FE8306-1 212. The spring loaded fitting of Figure 17 is shown together with a bent wire form 214 welded to the fitting. Figure 18 shows a spring loaded fitting 212 welded 220 to a long wire form hook 216, and a stabilizer tab 218 fitted to the fastener in order to create interference with the surface of the cargo control track thereby providing enhanced stability, limiting horizontal movement of the retention device. Figure 19 displays wire form hook shapes 220, 224, 226 attached to spring loaded fittings. These are non-limiting examples of supports capable of being inserted in an overhead receiving member cargo control track, such as in a ceiling-mounted application.

A cantilever support member is shown in Figure 20. An example of a cantilever support member includes but is not limited to a shelf bracket which is formed by welding a standard wood beam socket 228 to a rigid extended member 230. An example of a commercially available wood beam socket is such as Kinedyne Part No. 1845. An extended retention plate on the end 232 is also provided. Figure 21 exemplifies storage of various implements, including shovels 236, rakes 234, cords 240, cans 238 respectively on brackets 246, 244, 248 and shelf 242, wherein the brackets and shelf are arranged cooperating with receiving member track 140.

The present invention provides the advantage of combining the strength and economy of scale of cargo control track with the novel application of a plurality of cantilever load support devices including but not limited to hooks and brackets, tension load support devices and overhead mounted hooks and brackets which utilizing a retention device, cooperate with the receiving member receptacles of the cargo control track and may include a positive

retention latching device. The track or receiving member may be fastened by commonly known means, including but not limited to screws, bolts, welding, rivets, expansion anchor type, molly type or other suitable fastening methods.

According to the present invention, a storage system includes both horizontally and
5 vertically oriented receiving member cargo control tracks which may be affixed to either a free-standing support structure or the internal support structure of a building, vehicle or other supporting structure such as a fence or a wall.

Throughout this application, various publications and patents are referenced. The disclosures of these publications in their entireties are hereby incorporated by reference into
10 this application in order to more fully describe the state of the art.

This invention may be embodied in other forms or carried out in other ways without departing from the spirit or essential characteristics thereof. The present disclosure is therefore to be considered as in all respects illustrative and not restrictive, the scope of the invention being indicated by the appended Claims, and all changes which come within the
15 meaning and range of equivalency are intended to be embraced therein.

I claim:

1. A storage device comprising
 - a. a receiving member comprising one or more receiving member receptacles, the receiving member receptacle being defined by opposing end edges;
 - b. an insertion member comprising (i) a body portion capable of supporting a cantilever load and (ii) a retention device portion capable of being stably inserted into the receiving member receptacle.
2. A storage device comprising
 - a. a receiving member comprising one or more receiving member receptacles, the receiving member receptacle being defined by opposing end edges;
 - b. an insertion member comprising (i) a body portion capable of supporting a direct load and (ii) a retention device portion capable of being stably inserted into the receiving member receptacle.
3. The insertion member of claim 1, the body portion capable of supporting a tension load.
4. insertion member of claim 1, the retention device portion comprising one or more resilient fingers which define a notch, the notch formed to snugly fit into the receiving member receptacle.

5. The insertion member of claim 4, the retention device portion comprising a upper notch and an opposing lower notch.
6. The insertion member of claim 5, wherein the distance between the resilient fingers of the upper notch and the resilient fingers of the opposing lower notch is greater than the distance between the opposing end edges defining the receiving member receptacle.
7. The insertion member of claim 1, the retention device portion comprising one or more resilient fingers positioned so as to contact and engage an opposing end edge of the receiving member receptacle.
8. The insertion member of claim 4, the retention device portion further comprising one or more resilient fingers adjacent the notch and positioned so as to contact and engage an opposing end edge of the receiving member receptacle.
9. The insertion member of claim 5, wherein the upper notch is larger than the lower notch.
10. The insertion member of claim 1, the retention device portion further comprising a latching device capable of interfering with one of the opposing end edges of the receiving member receptacle.

11. The insertion member of claim 10, wherein the latching device is movable with respect to the retention device portion.
12. The insertion member of claim 10, wherein the latching device comprises a mechanically actuated lever.
13. The insertion member of claim 12, wherein the mechanically actuated lever is actuated by compressing a resilient material.
14. The insertion member of claim 13, wherein the resilient material is a spring.
15. The insertion member of claim 10, wherein the latching device is disposed within the notch.
16. The movable latching device of claim 11, wherein the latching device or a portion thereof pivots with respect to the retention device portion.
17. The movable latching device of claim 11, wherein the latching device or a portion thereof slides with respect to the retention device portion.
18. The insertion member of claim 10, wherein the latching device is disposed between the resilient fingers and positioned so as to contact and engage an opposing end edge of the receiving member receptacle.

19. The elongated body portion of claim 1.

20. The receiving member of claim 1, wherein the receiving member receptacles are linearly positioned along the receiving member.

21. The storage device of claim 1, wherein the receiving member is formed from one of the group consisting of metal, wood and plastic.

22. The storage device of claim 21, wherein the receiving member is formed from the group consisting of aluminum, ~~titanium~~ and steel.

23. The storage device of claim 1, wherein the receiving member is capable of being removably mounted on a fixed surface.

24. The insertion member of claim 1, wherein the body portion is elongated.

25. The insertion member of claim 1, wherein the body portion is selected from the group consisting of a hook, a ring a pronged implement holder and a bracket.

26. The storage system of claim 1, wherein the storage system is free standing.

27. The storage system of claim 1, wherein the storage system is mounted to a fixed surface.

28. The storage system of claim 1, wherein the receiving member is horizontal in orientation.

29. The storage system of claim 1, wherein the receiving member is vertical in orientation.

30. A method for storage of implements comprising using the device of claim 1.

FAST TRACK SHELVING SYSTEM

ABSTRACT

5

The present invention provides a storage device comprising (a) a receiving member comprising one or more receiving member receptacles, the receiving member receptacle being defined by opposing end edges; and (b) an insertion member comprising (i) a body portion capable of supporting a cantilever load and (ii) a retention device portion capable of being

10 stably inserted into the receiving member receptacle. The present invention further provides a free standing storage system. The present invention also provides a storage system mountable to a fixed surface.

DECLARATION AND POWER OF ATTORNEY FOR PATENT APPLICATION

As below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below under my name.

I believe that I am the original and first inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled

FAST TRACK SHELVING SYSTEM

the Specification of which

- ☒ is attached hereto
☐ was filed on _____
as Application Serial No. _____
and was amended on _____ (if applicable).

I hereby state that I have reviewed and understand the contents of the above-identified Specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, 1.56(a).

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any provisional application filed in the United States in accordance with 35 U.S.C. §1.119(e), or any application for patent that has been converted to a Provisional Application within one (1) year of its filing date, or any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed.

<u>APPLICATION</u> <u>NUMBER</u>	<u>PRIOR FILED APPLICATION(S)</u> <u>COUNTRY (DAY/MONTH/YEAR FILED)</u>	<u>PRIORITY</u> <u>CLAIMED</u>
-------------------------------------	--	-----------------------------------

N O N E

I hereby claim the benefit under Title 35, United States Code, §120 of any United States application listed below, and, insofar as the subject matter of each of the claims of this application is not disclosed in any prior United States application in the manner provided by the first paragraph of Title 35, United States Code, §112, I acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations, §1.56(a), which occurred between the filing date of the prior application and the national or PCT international filing date of this application:

N O N E

I hereby appoint as my attorneys or agents the following person: Steven B. Stein (Registration No. 43,159), said attorneys or agents with full power of substitution and revocation to prosecute this application and transact all business in the Patent and Trademark Office connected therewith.

Please address all correspondence regarding this application to:

STEVEN B. STEIN, ESQ.
STEIN & STEIN
164 ROUTE 10 WEST
SUCCASUNNA, NEW JERSEY 07876

Direct all telephone calls to Steven B. Stein at (973) 252-1080.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further, that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
